Why Observables?

We can do much more with observables than with promises.

With observables, we have a whole bunch of operators to pull from, which let us customize our streams in nearly any way we want.

<https://auth0.com/blog/2015/10/15/angular-2-series-part-3-using-http/>

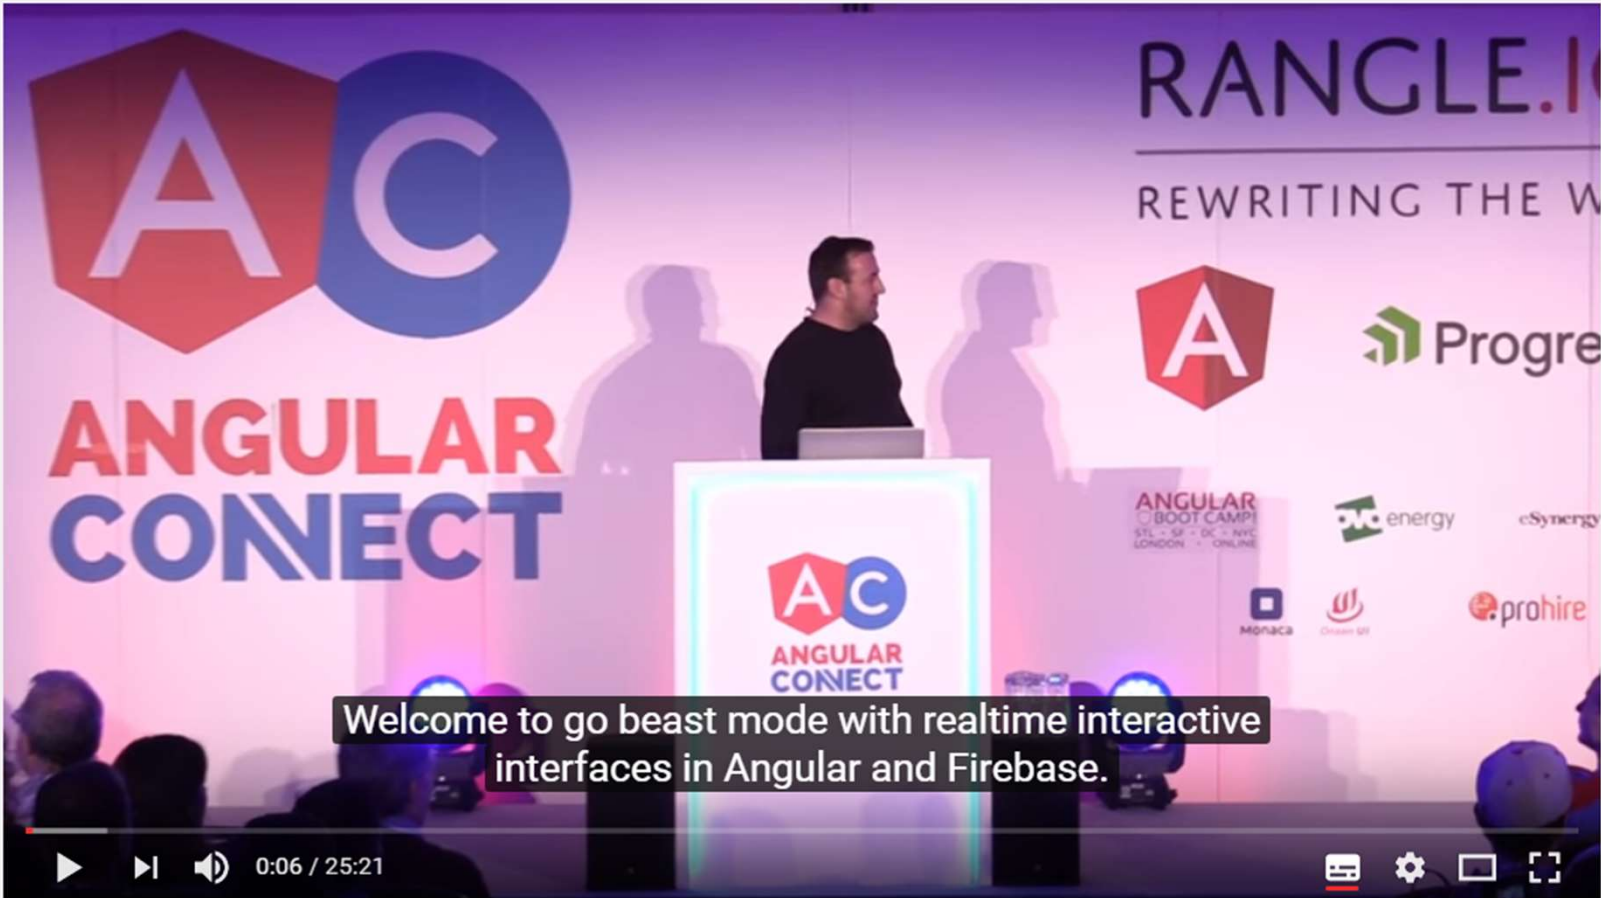

Observables en RxJs

- “Reactive Programming”
 - *“Reactive programming is programming with asynchronous data streams.”*
 - <https://gist.github.com/staltz/868e7e9bc2a7b8c1f754>
- Observables have additional features, compared to Promises
 - Mapping
 - Filtering
 - Combining
 - Cancel
 - Retry
 - ...
- SO: no more `.success()`, `.error()` and `.then()` chaining!

How do observables work

- First - *The Observable Stream*
- Later - all 10.000 operators...
- Traditionally:

A screenshot of a YouTube video player. The video shows a man standing at a podium with the Angular Connect logo on it. Behind him is a large screen displaying the Angular Connect logo and the text "RANGLE.I" and "REWRITING THE W". The screen also features logos for various sponsors including Progre, energy, eSynergy, MONACA, and prohire. A subtitle at the bottom of the video reads: "Welcome to go beast mode with realtime interactive interfaces in Angular and Firebase." The video player interface shows a progress bar at 0:06 / 25:21 and various control icons.

Go beast mode with realtime reactive interfaces in Angular 2 & Firebase | Lukas Ruebbelke

<https://www.youtube.com/watch?v=5CTL7aqSvJU>

<https://youtu.be/5CTL7aqSvJU?t=4m31s>

- With Observables -
 - a system, already outputting data,
 - Subscribe to that data
- "trade Output for Input"
- "Push vs. Pull"

"The observable sandwich"

**Not really Magic.
Just operators**

Subscribe to events

Project: ../180-observables-from-scratch

Workshop

- Create your own Angular app
- Give it some UI, add for example a textbox and a button
- Create observables, based on the DOM-elements
 - For example – handle button clicks, handle text input
- Subscribe to the observables, updating the UI on changes
- Generic example `../180-observable-from-scratch`.
 - In the `\advanced` repo

Async Http-services with RxJS/Observables

Reactive programming with asynchronous streams

On repeat... (as an example)

Home (default component) Smart/View component

Default component- My favorite cities:

1 - Groningen <input type="checkbox"/> Visited
2 - Hengelo <input type="checkbox"/> Visited
3 - Den Haag <input type="checkbox"/> Visited
4 - Enschede <input type="checkbox"/> Visited
5 - Heerlen <input type="checkbox"/> Visited

Current city: Den Haag

Deze naam aanpassen mbv. Beeld, Kop en voettekst

Async Services

- Statische data ophalen: *synchrone* actie
- Werken via `HttpClient`: *asynchrone* actie
- Angular 1: `Promises`
- Angular 2: `Observables`

Bovendien in Angular 2: `ReactiveX` library

`RxJS`

In code:

Initial Output

```
this.http.get<City[]>('assets/data/cities.json')  
  .pipe(  
    delay(...),  
    map(...)  
  )  
  .subscribe((result:City[]) => {  
    //... Do something  
  });
```

Optioneel:
operator(s)

Final Input

Ook: importeren HttpClientModule in @ngModule

- *// Angular Modules*
...
• **import** {HttpClientModule} **from** '@angular/common/http';
// Module declaration
@NgModule({
 imports : [BrowserModule, HttpClientModule],
 declarations: [AppComponent],
 bootstrap : [AppComponent],
 ...
})
export class AppModule {
}

Workshop

- Bekijk nogmaals het voorbeeld in `/300_smart_view_components`
- Maak een eigen `.json`-bestand en importeer dit in je applicatie.
- Subscribe je op het resultaat uit de JSON-file en toon dit in de UI
- Optional: verdeel de logica over een service/component

Async pipe

Automatische `.subscribe()` en `.unsubscribe()`

Async Pipe

- Bij `.subscribe()`, eigenlijk ook `.unsubscribe()` aanroepen.
 - Netjes!
 - Bij HTTP-requests niet beslist nodig, bij andere subscriptions wel, in verband met memory leaks.
- Niet meer zelf `.subscribe()` en `.unsubscribe()` aanroepen:
 - Gebruik `async pipe` van Angular

- In de component:

```
Cities$: Observable<City[]>; // Nu: Observable naar Type  
...
```

```
ngOnInit() {  
    // Call naar de service, retourneert Observable  
    this.cities$ = this.cityService.getCities()  
}
```

- In de view:

```
<li *ngFor="let city of cities$ | async">
```

Werken met Live API's

- Country API
- <https://restcountries.eu/>
- Fetching country data by name

Workshop

- Create your own HTTP-app that talks to some API endpoint
- <https://restcountries.eu/>
- <https://www.omdbapi.com/?apikey=f1f56c8e& ...>
- <http://swapi.co>
- <https://pokeapi.co/>

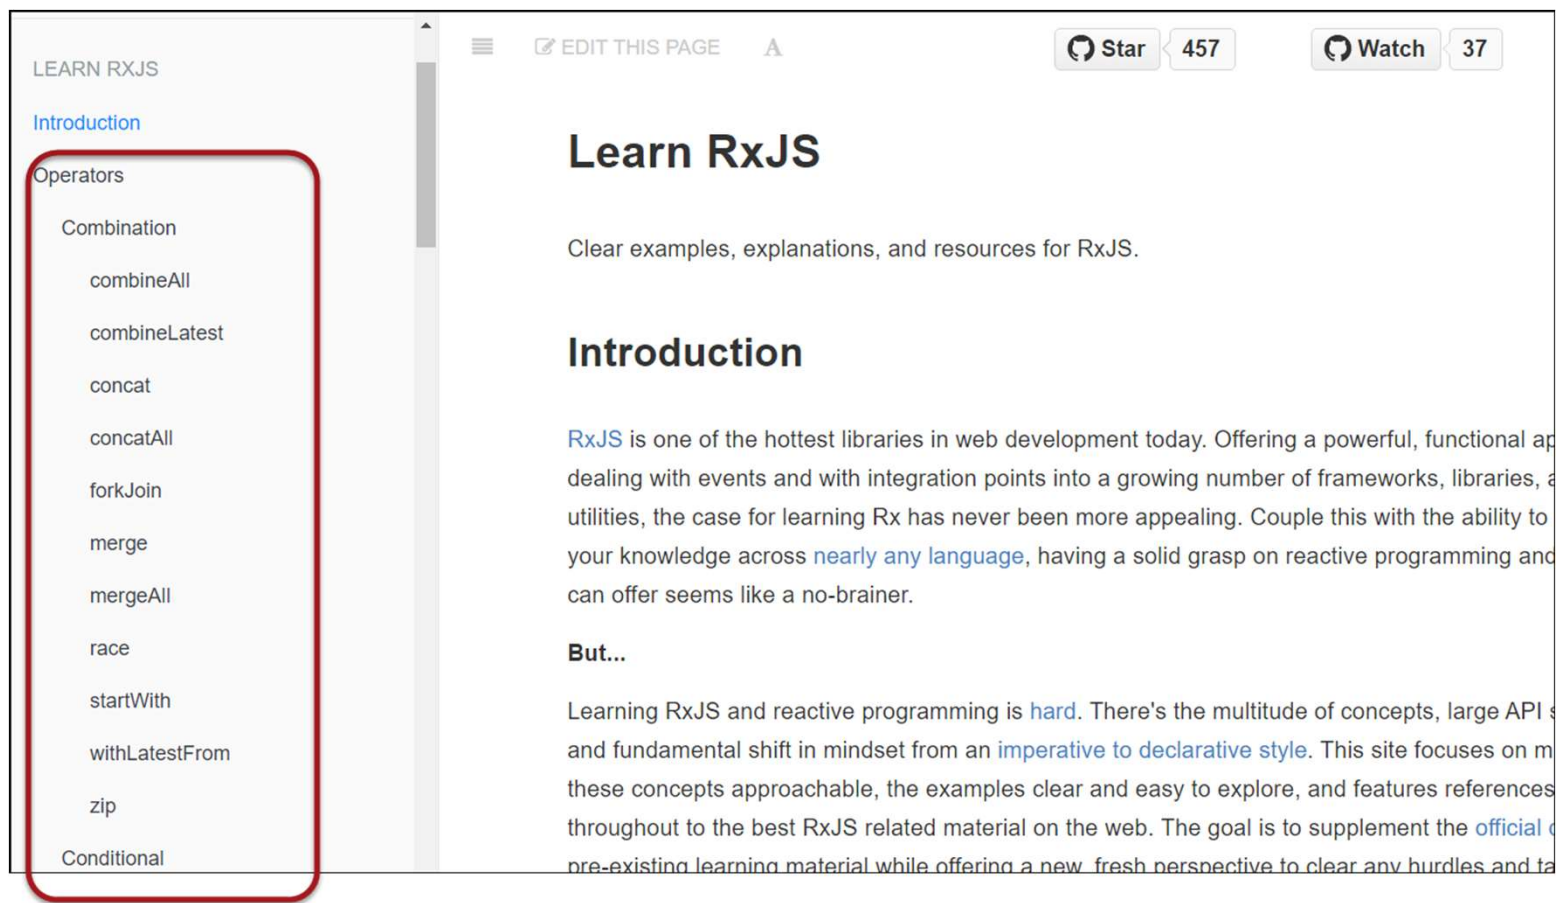

More on operators

Transforming your stream in the `.pipe()` function

The Problem with RxJS Operators...

- There are so many of them...

The screenshot shows the 'Learn RxJS' website. On the left, a sidebar lists various RxJS operators under the heading 'Operators'. The operators listed are: combineAll, combineLatest, concat, concatAll, forkJoin, merge, mergeAll, race, startWith, withLatestFrom, and zip. These operators are grouped under a 'Combination' sub-heading. The main content area on the right is titled 'Learn RxJS' and 'Introduction'. It contains text about RxJS being a popular library and the challenges of learning it. The sidebar is highlighted with a red border, emphasizing the large number of operators available.

Interactive diagrams of Rx Observables

`combineLatest((x, y) => "" + x + y)`

Fork me on GitHub

Built on RxJS v5.0.3

<https://rxmarbles.com/>

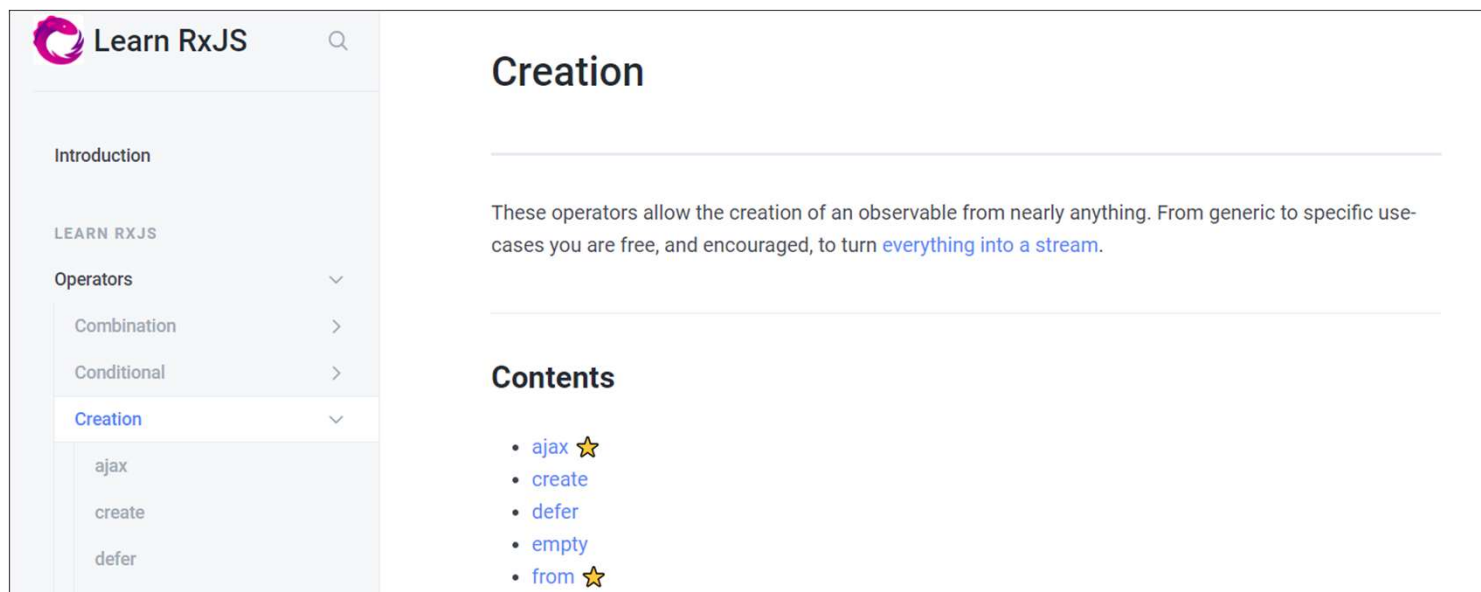

Basic streams

Creating observables from scratch

Turn something into an observable

- Basic creation operators
 - `create()` – create an observable manually
 - `from()` – turn an array, promise or iterable into an observable
 - `fromEvent()` – turn an event into an observable
 - `of()` – turn a variable into an observable, emit its value(s) and complete
- <https://www.learnrxjs.io/learn-rxjs/operators/creation>

Creating an observable from a textbox

```
<input class="form-control-lg" type="text" #text1
      id="text1" placeholder="Text as a stream">
<p>{{ textStream1 }}</p>
```

```
textStream1 = 'Type some text above...';
@ViewChild('text1', {static: true}) text1; // two parameters for @ViewChild()

// Suggestion: break the onInit() up in smaller functions
ngOnInit(): void {
  this.onTextStream1();
}

onTextStream1() {
  fromEvent(this.text1.nativeElement, 'keyup')
    .subscribe((event: any) => this.textStream1 = event.target.value);
}
```

Result

Basic stream: we subscribe to chars coming from the textbox:

Text as a stream

Type some text above...

Basic stream: we subscribe to chars coming from the textbox:

This is a stream...

This is a stream...

Workshop

- Create a textbox.
 - Add items that are typed in, to a Todo-list
 - Use an observable to subscribe to keyup-events.
- Capture key events, test if the key pressed is the Enter-key
 - If it's Enter, Add the current value of the textbox to a static array `todoItems[]`
- Example `../basic-stream/basic-stream.component.ts`
 - Start from scratch or expand this component

Using the pipe()

- We can transform the stream by adding operators to the pipeline
- Inside the pipeline we calculate new values and bind them to the UI, using generic attribute binding [...]

```
<button #btnRight class="btn btn-secondary">Right</button>
Mario is moved by observable streams from the button click.
<div>
  
</div>
```

Inside our class

```
// mario
position: any;
@ViewChild('btnRight', {static: true}) btnRight;
```

```
fromEvent(this.btnRight.nativeElement, 'click')
  .pipe(
    map(event => 10), // 1. map the event to a useful value, in this case 10px
    startWith({x: 100, y: 100}), // 2. start with an object of { 100, 100}.
    scan((acc: any, current: number) => { // 3, use the scan operator as reducer function.
      return {
        x: acc.x + current,
        y: acc.y
      };
    })
  )
  .subscribe(result => {
    this.position = result;
  });
```

The result of the previous operator is the input of the next operator in the pipeline

Result

Right

Mario is moved by observable streams from the button click.

Workshop

- Create button that moves Mario to the left.
- Example `../basic-stream/basic-stream.component.ts`
 - Start from scratch or expand this component

Combining streams

There are **a lot** of options to combine multiple streams into one stream

Options for combining streams

- `combineLatest()` - When any observable emits a value, emit the last emitted value from each
- `concat()` - Subscribe to observables in order as previous completes
- `forkJoin()` - When all observables complete, emit the last emitted value from each
- `merge()` - Turn multiple observables into a single observable
- `startWith()` - Emit given value first
- <https://www.learnrxjs.io/learn-rxjs/operators/combo>

Use case: move Mario

- Create four buttons to move Mario in different directions
 - all combined in one stream and one subscription

Template

```
<button #btnLeft> Left </button>
<button #btnRight> Right </button>
<button #btnUp> Up </button>
<button #btnDown> Down </button>
<hr>

```

```

position: any;
@ViewChild('btnLeft', {static: true}) btnLeft;
@ViewChild('btnRight', {static: true}) btnRight;
@ViewChild('btnUp', {static: true}) btnUp;
@ViewChild('btnDown', {static: true}) btnDown;

ngOnInit(): void {
  // Create multiple streams
  const right$ = fromEvent(this.btnRight.nativeElement, 'click')
    .pipe(
      map(event => {
        return {direction: 'horizontal', value: 10};
      }) // 10 px to the right
    );
  const left$ = fromEvent(this.btnLeft.nativeElement, 'click')
    .pipe(
      map(event => {
        return {direction: 'horizontal', value: -10};
      }) // -10 px to the left
    );
  ...
  // combine our streams
  merge(right$, left$, up$, down$)
    .pipe(
      startWith({x: 200, y: 100}),
      scan((acc: any, current: any) => {
        return {
          x: acc.x + (current.direction === 'horizontal' ? current.value : 0),
          y: acc.y + (current.direction === 'vertical' ? current.value : 0)
        };
      })
    ).subscribe(result => {
      this.position = result;
    });
}

```

Create 4 different streams

Merge the streams

One subscriber

Sequencing streams

Use streams to start other streams so you can use the combined behavior

Use case: drag & drop

- We want to move Mario around with the mouse: **drag-n-drop**
- We compose different streams for that:
 - `down$`, when the mouse is pressed
 - `move$`, when the mouse is moved, return the current mouse position
 - `up$`, when the mouse is released
- Again, we have only one (1) subscription
 - **Subscribe** to the `down$`. This is the initiator
 - After the initial event, **switch** to the `move$`: using the `switchMap()` operator
 - But only **until** the `up$` event occurs!
 - Then complete the observable and release Mario
- This translates to the following code:

// correction factor for image and current page. Your mileage may vary!

const OFFSET_X = 180;

const OFFSET_Y = 280;

// 1. With Drag and drop, first you capture the mousedown event

const down\$ = fromEvent(document, 'mousedown');

Compose streams

// 2. What to do when the mouse moves

const move\$ = fromEvent(document, 'mousemove')

.pipe(
 map((event: **any**) => {
 return {x: event.pageX - OFFSET_X, y: event.pageY - OFFSET_Y}; *// OFFSET as correction factor*
 })
);

// 3. Capture the mouseup event

const up\$ = fromEvent(document, 'mouseup');

// 4. extend the down\$ stream and subscribe

**Switch execution to
another observable**

down\$
 .pipe(
 *// IF the down\$-event happens, we are no longer interested in it. Instead,
 // we switch the focus to the move\$ event.
 // BUT: we are only interested in the move until the mouse is released again.
 // So we add *another* pipe and use the takeUntil() operator.*
 switchMap(event => move\$.pipe(
 takeUntil(up\$)
)),
 startWith(**this**.position)
)
 .subscribe(result => **this**.position = result);

**Subscribe and
update position**

}

Result

`../streams/drag-drop-stream.component.html | ts`

An autocomplete/typeahead demo

An autocomplete/typeahead demo

bel

Belarus

Minsk

Belgium

Brussels

Belize

Belmopan

Palau

Ngerulmud

Template

As per usual – little HTML

```
<h4>An autocomplete/typeahead demo</h4>
<!--Get the keyword, the class is subscribed to this inputbox-->
<input type="text" placeholder="Country name..."
      #typeahead class="form-control-lg">
<hr/>
<!--Results-->
<ul class="list-group">
  <li class="list-group-item" *ngFor="let country of countries$ | async ">
    
    <p>
      <strong>{{ country.name }}</strong><br>
      {{ country.capital }}
    </p>
  </li>
</ul>
```

This time: using the
async pipe

Code

```
interface ICountry {  
  name: string;  
  capital: string;  
  flag: string;  
}  
  
const errorCountry: ICountry = {  
  name: 'Error',  
  capital: 'Not found',  
  flag: ''  
};
```

Creating interface and simple error message

```
@ViewChild('typeahead', {static: true}) typeahead;  
countries$: Observable<ICountry[]>;  
  
constructor(private http: HttpClient) {  
}
```

Inside the component class

```
ngOnInit(): void {  
  this.countries$ = fromEvent(this.typeahead.nativeElement, 'keyup')  
    .pipe(  
      filter((e: any) => e.target.value.length >= 2),  
      debounceTime(400),  
      map((e: any) => e.target.value),  
      distinctUntilChanged(),  
      switchMap(keyword => this.getCountries(keyword))  
    );  
}
```

Main method. See example code for comments

../streams/typeahead-stream.component.html | ts

Fetching the countries

```
getCountries(keyword): Observable<ICountry[]> {  
  // 7. Create the actual http-call.  
  return this.http  
    .get<ICountry[]>(`https://restcountries.eu/rest/v2/name/${keyword}?fields=name;capital;flag`)  
    .pipe(  
      // 8. catch http-errors and return a 'not found' country  
      catchError(err => {  
        console.log(err);  
        return of([errorCountry]);  
      })  
    );  
}
```

Documentation:

- filter: <https://www.learnrxjs.io/learn-rxjs/operators/filtering/filter>
- debounceTime: <https://www.learnrxjs.io/learn-rxjs/operators/filtering/debounceTime>
- distinctUntilChanged: <https://www.learnrxjs.io/learn-rxjs/operators/filtering/distinctUntilChanged>
- switchMap: <https://www.learnrxjs.io/learn-rxjs/operators/transformation/switchmap>
- catchError: https://www.learnrxjs.io/learn-rxjs/operators/error_handling/catch

Workshop

- Search movies in the Open Movie Database.
 - `https://www.omdbapi.com/?apikey=f1f56c8e&s=[keyword]`
 - Create an AutoComplete inputfield for movie titels.
 - For instance, if you type 'ava...' it should show movies like Avatar, and more
- Example `../basic-stream/typeahead.component.ts`
 - Start from scratch or expand this component

More operators

Getting familiar with some of the more used operators

map() and mapTo()

```
const source = from([1, 2, 3, 4, 5, 6, 7, 8, 9, 10]);

// .map() - apply a function every emitted output.
source.pipe(
  map((val: number) => val = val * 10)
)
  .subscribe(result => this.mapData.push(result));

// .mapTo() - map the emission to a constant value
source.pipe(
  mapTo('Hello World')
)
  .subscribe(result => this.mapToData.push(result));
```

filter()

```
const source      = Observable.from([1, 2, 3, 4, 5, 6, 7, 8, 9, 10]);
const sourceCities = Observable.from([
  'Haarlem',
  'Breda',
  'Amsterdam',
  'Groningen',
  'Hengelo',
  ...
]);
```

*// filter() - only emit values that pass the provided condition.
// In this case: only even numbers are passed through.*

```
source.pipe(
  filter(val => val % 2 === 0)
)
.subscribe(result => this.filterData.push(result));
```

// Emit only the cities that starts with an 'H'.

```
sourceCities.pipe(filter(city => city.startsWith('H')))
.subscribe(result => this.cityData.push(result));
```

scan()

```
const source = Observable.from([1, 2, 3, 4, 5, 6, 7, 8, 9, 10]);
```

*// .scan() acts as the classic .reduce() function on array's. It takes an
// accumulator and the current value. The accumulator is persisted over time.*

```
source
  .pipe(
    startWith(0),
    scan((acc, curr) => acc + curr)
  )
  .subscribe(result => this.scanData.push(result));
```

concat()

- Concat subscribes to observables *in order*.
- “Only when the first one completes, let me know.”
- Then move on to the next one.
- Use `concat()` when the order of your observables matters.
- Example code: simulated delay.
 - The second observable (which is finished first) only emits when the first observable completes.

app/shared/services/data.service.ts

// constants that are used as pointers to some json-data

const BOOKS: string = 'assets/data/books.json';

const AUTHORS: string = 'assets/data/authors.json';

```
getConcatData(): Observable<any> {  
  // First call. Simulate delay of 1 second  
  const authors = this.http.get(AUTHORS)  
    .pipe(  
      delay(2000)  
    );  
  // Second call. Simulate delay of 2 seconds  
  const books = this.http.get(BOOKS)  
    .pipe(  
      delay(1000)  
    );  
  
  // return the concatenated observable. It will always deliver  
  // FIRST the results of the first call. No matter how long the delay.  
  return concat(authors, books);  
}
```

merge()

- Merge combines multiple observables into one single observable.
- It emits *as soon as* it gets a result.
- Use `merge()` when order of observables is not important.

```
getMergeData(): Observable<any> {  
  // First call. Simulate delay of 3 seconds, so this observable will emit last.  
  const authors = this.http.get(AUTHORS)  
    .pipe(  
      delay(3000)  
    );  
  
  // Second call. Simulate delay of 1 seconds, so this observable will emit first.  
  const books = this.http.get(BOOKS)  
    .pipe(  
      delay(1000)  
    );  
  
  // return the merged observable. BOOKS will be delivered first  
  return merge(authors, books);  
}
```

mergeMap()

- Merges the value of an inner observable into an outer observable.
- Need only the *last* value emitted? Use `.switchMap()`.
- Use this for example to retrieve results in a second observable, based on the output of a first observable

.mergeMap() result

See </app/shared/services/data.service.ts> for example code.

We are looking for books by authorName here. But we only have an authorId, not a name.

```
[
  {
    "title": "Web Development Library - TypeScript",
    "author": "Peter Kassenaar",
    "bookID": 1
  },
  {
    "title": "Web Development Library - Angular",
    "author": "Peter Kassenaar",
    "bookID": 2
  }
]
```

```

getMergeMapData(authorID: number = 0): Observable<any> {
  // first http-call, outer observable.
  return this.http.get(AUTHORS)
    .pipe(
      tap(response => console.log(response)),
      map((authors: any[]) => {
        console.log(authors);
        // find the correct author, using the array .find() method
        return authors.find((author: any) => author.id === authorID);
      }),
      mergeMap((author: any) => {
        if (author) {
          // second http-call, inner observable
          return this.http.get(BOOKS)
            .pipe(map((books: any[]) => {
              // filter books, bases on authername we found earlier.
              return books.filter((book: any) => book.author === author.name);
            }));
        } else {
          // nothing found. Return empty array
          return of([]);
        }
      })
    );
}

```

.forkJoin()

- Make multiple (http) requests and return one combined response *once all observables are completed*.
- `.forkJoin()` returns an array with the last emitted value from each observable.
- Compose results as per your needs

```

getForkJoinData(): Observable<any> {
  return forkJoin(
    // first call
    this.http.get(AUTHORS)
      .pipe(
        delay(3000)
      ),
    // second call
    this.http.get(BOOKS)
  )
  .pipe(
    map((data: any[]) => {
      // data is now an array with 2 objects, b/c we did 2 http-calls.
      // First result, from the http-call to AUTHORS
      const author: any = data[0][0]; // Get just first author from file.
      // Second result, from the http-call to BOOKS
      const books: any[] = data[1];
      // Compose result, in this case adding the books to the extracted author.
      author.books = books.filter(book => book.author === author.name);
      return author;
    })
  );
}

```

Other interesting / often used Operators

- `from()`, `of()` - create observables from almost everything
- `fromEvent()` - create observable from a DOM-event.
- `debounce()`, `debounceTime()` - Discard emitted values that take less than the specified time between output
- `tap()` - utility operator - transform side-effects, such as logging
- ...and much more... See <http://www.learnrxjs.io>

Angular Multiple HTTP Requests with RxJS

Cory Rylan
Nov 15, 2016
Updated Jun 18, 2019 - 5 min read

[angular](#) [rxjs](#)

This article has been updated to the latest version of [Angular](#) 9 and tested with Angular 8. The content is likely be applicable for older Angular 2 or other previous versions.

A typical pattern we run into with single page apps is to gather up data from multiple API endpoints and then display the gathered data to the user. Fetching numerous asynchronous requests and managing them can be tricky but with the Angular's Http service and a little help from the included RxJS library, it can be accomplished in just a few of lines of code. There are multiple ways to handle multiple requests; they can be sequential or in parallel. In this post, we will cover both.

Angular Form **Essentials**

Learn the essentials to get started creating amazing forms with Angular!

RxJS—Six Operators That you Must Know

```
class TakeSubscriber<T> extends Subscriber<T> {  
  private count: number = 0;  
  
  constructor(destination: Subscriber<T>, private total: number) {  
    super(destination);  
  }  
  
  protected _next(value: T): void {  
    const total = this.total;  
    const count = ++this.count;  
    if (count <= total) {  
      this.destination.next(value);  
    }  
  }  
}
```

Workshop

- Create a call to the Open Movie Database API, using a keyword to search for 10 movies
 - <http://www.omdbapi.com/?apikey=f1f56c8e&s=<keyword>>
- Create an additional call to get details for every movie returned. Use the `imdbID` property for that
 - <http://www.omdbapi.com/?apikey=f1f56c8e&i=<imdbID>>
- Display results in the UI, first a list of movies, then details per movie as soon as they come available.
- What is your best solution? Multiple ways of doing this!
